### Research Experience Details:

#### Ph.D:

Medical image security is an important requirement of teleradiology. The work on “Medical Image Security - Search for Generic Solution” involved designing, implementing and validating contourlet based, genetic algorithm optimized medical image watermarking algorithms. This work makes a progressive step in the direction of developing a generic solution for medical image security by providing watermarking algorithms that exploit the multi-resolution characteristics of CT and the adaptive nature of GA. The successful application of the GA-based watermarking algorithms in contourlet domain, developed in this work for watermarking both gray and color medical images of various modalities is likely to enhance research interest for providing generic solutions not only for security in medical image transmission across public network, but also may serve as a viable tool for highly textured multispectral images such as satellite imagery of sensitive information.
